

Tab Title: Cost-efficient Performance

The End of High-Cost Barriers in Taste-Masking

Historically, neutralizing the metallic or intensely bitter profiles of active pharmaceutical ingredients (APIs) has been synonymous with complex and prohibitive industrial costs. Legacy technologies—such as microencapsulation, polymer coating (e.g., Eudragit®), or Hot Melt Extrusion (HME)—demand specialized infrastructure, multi-stage production cycles, and high energy consumption.

These operational hurdles significantly inflate the final product's cost, often compromising profitability in price-sensitive or highly regulated generic markets.

A Paradigm Shift in Pharmaceutical Economics

The BPS platform breaks this cycle. Our proprietary technology does not rely on expensive physical barriers or energy-intensive machinery. Instead, it utilizes an innovative **ternary chemical synergy** (Sodium Citrate, Citric Acid, and Sucralose) that modulates the oral micro-pH to effectively block bitterness receptors at the molecular level.

Unrivaled Industrial Advantages

By choosing the BPS platform, manufacturers gain a decisive competitive edge through radical process optimization:

- **Standard Direct Mixing:** Our formulation is achieved through simple physical blending. This is a standard, low-energy process that utilizes existing equipment found in any pharmaceutical facility.
- **Zero Thermal or Aqueous Phases:** We eliminate the need for freeze-drying, spray-drying, or wet granulation. By removing the requirements for water, heat, and solvents, we drastically reduce both **CapEx** and operational timelines.
- **Immediate Scalability:** The technology is designed for a **Seamless Tech Transfer**. It is fully compatible with standard manufacturing lines, facilitating a rapid and cost-effective transition to high-volume production of Stick Packs, ODTs, and other modern dosage forms.

BPS: High-performance palatability. Optimized production economics.
